Tree

\[ \text{root}_A \]

\[ 1_A \quad 2_A \quad 3_A \]

\[ \text{root} \]
Definition 0.1 A tree is defined in several ways:

1. A connected, undirected, acyclic graph. It is rooted and ordered unless otherwise specified.

2. A data structure accessed beginning at the root node. Each node is either a leaf or an internal node. An internal node has one or more child nodes and is called the parent of its child nodes. All children of the same node are siblings.

3. A tree is either empty (no nodes), or a root and zero or more subtrees. The subtrees are ordered.

Digital search tree

![Diagram of a digital search tree with nodes labeled A_{000}, C_{010}, B_{001}, D_{011}, H_{111}, and G_{110}. The tree branches are labeled with 0 and 1.]
Digital search tree

A digital search tree is a dictionary implemented as a digital tree which stores strings in internal nodes, so there is no need for extra leaf nodes to store the strings.

Internal path length

The internal path length of a tree is the sum of the depth of every node of the tree.
Internal path length

Fundamental recurrence relation

\[ A_N = N - 1 + \sum_{k=0}^{\infty} \frac{1}{2^{N-1}} \binom{N - 1}{k} (A_k + A_{N-1-k}), \quad N \geq 1 \]

with \( A_0 := 0 \).
Internal path length

Transformation

\[ \sum_{N=1}^{\infty} \frac{A_N z^{N-1}}{(N-1)!} = ze^z + 2 \sum_{k=0}^{\infty} \frac{A_k}{k!} \left( \frac{z}{2} \right)^k e^{\frac{z}{2}} \]

\[ A'(z) = ze^z + 2A \left( \frac{z}{2} \right) e^{\frac{z}{2}} \]
Internal path length

Substitution by $B(z)$

$$A(z) = e^z B(z) = \left( \sum_{N=0}^{\infty} \frac{z^N}{N!} \right) \left( \sum_{N=0}^{\infty} B_N \frac{z^N}{N!} \right)$$

$$A_N = \sum_{k=0}^{N} \binom{N}{k} B_k$$
Internal path length

Substitution by $B(z)$

$$A'(z) = ze^z + 2A\left(\frac{z}{2}\right) e^{\frac{z}{2}}$$

$$B'(z) + B(z) = z + 2B\left(\frac{z}{2}\right)$$

$$B_N + B_{N-1} = \frac{1}{2^{N-2}} B_{N-1}$$
Internal path length

Substitution by $B(z)$

$$B_N = (-1)^N \prod_{j=1}^{N-2} \left(1 - \frac{1}{2^j}\right)$$
Internal path length

Introduction of $Q_N$

\[ Q_N = \prod_{j=1}^{N} \left( 1 - \frac{1}{2^j} \right) \]
Internal path length

Introduction of \( Q(x) \)

\[
Q(x) = \prod_{j=1}^{\infty} \left(1 - \frac{x}{2^j}\right)
\]

\[Q(1) = Q_{\infty}\]
Internal path length

\(Q(x)\) is used for a meromorphic function of \(Q_N\)

\[Q_N = \frac{Q(1)}{Q(2^{-N})}\]
Internal path length

The function $Q(x)$
Internal path length

Explicit formula for $A_N$

$$A_N = \sum_{k=2}^{N} \binom{N}{k} (-1)^k \frac{Q(1)}{Q(2^{-k+2})}$$
Internal path length

Rice’s method

\[ \sum_{k=0}^{N} \binom{N}{k} (-1)^k f(k) = -\frac{1}{2\pi i} \int_{C} B(N + 1, -z) f(z) \, dz \]
Internal path length

Application of Rice’s method

\[ A_N = -\frac{1}{2\pi i} \int_C B(N + 1, -z) \frac{Q(1)}{Q(2^{-z+2})} dz \]
Internal path length

Beta-Function

\[ B(p, q) = \frac{\Gamma(p) \Gamma(q)}{\Gamma(p + q)} \]
Internal path length

Beta-Function
Internal path length

Gamma-Function
Internal path length

Cauchy’s theorem

If \( f(z) \) is analytic in \( C \) except final number of poles \( a_1, a_2, \ldots, a_n \) inside \( C \), then

\[
\frac{1}{2\pi i} \int_C f(z) \, dz = \sum_{k=1}^{n} \text{Res}_{z=a_k} f(z)
\]
Internal path length

Approximation with Rectangle $R_{XY}$ with $(\frac{1}{2} \pm iY, X \pm iY)$

$$A_N = -\frac{1}{2\pi i} \int_{R_{XY}} B(N + 1, -z) \frac{Q(1)}{Q(2-z+2)} dz - Res_{R_{XY}/C}$$
Internal path length

Approximation of the integral

\[
\frac{1}{2\pi i} \int_{R_{XY}} B\left(N + 1, -z\right) \frac{Q(1)}{Q(2-z+2)} dz = \\
O\left(\int_{-Y}^{Y} \frac{\Gamma(N + 1)}{\Gamma\left(N + \frac{1}{2} - iy\right)} dy\right) = O\left(\int_{-Y}^{Y} N^{1/2 - iy} dy\right) = O\left(N^{1/2}\right)
\]
Internal path length

Residue at $z = 1$

$$-B(N + 1, -z) = -\frac{N}{z - 1} - N(H_{N-1} - 1) + O(z - 1)$$

$$H_{N-1} = \gamma + \ln N - O\left(\frac{1}{N}\right)$$

$$-B(N + 1, -z) = -\frac{N}{z - 1} - N(\gamma + \ln N - 1) + O(z - 1)$$
Internal path length

Residue at $z = 1$

\[
\frac{Q(1)}{Q(2^{-z}+1)} = 1 - \alpha \ln 2 (z - 1) + O((z - 1)^2)
\]
Internal path length

Residue at $z = 1$

\[
\frac{1}{1 - 2^{-z+1}} = \frac{1}{1 - e^{\ln 2(-z+1)}}
\]

\[
= -\frac{1}{(-z + 1) \ln 2} + \frac{1}{2} \frac{-z + 1}{12} + O \left((-z + 1)^3\right)
\]

\[
= \frac{1}{(z - 1) \ln 2} + \frac{1}{2} + O (z - 1)
\]
Internal path length

Residue at $z = 1$

$$\Delta_{z=1} = -N \lg N - N \left( \frac{\gamma - 1}{\ln 2} - \alpha + \frac{1}{2} \right) + O(1)$$
Internal path length

Residues at $z = j \pm \frac{2\pi ik}{\ln 2}$ for $Q(2^{-z+j})$

$$
\Delta_{z=1} = 1 \pm \frac{2\pi ik}{\ln 2} = -N \delta(N) + O(1)
$$

where

$$
\delta(N) = \frac{1}{\ln 2} \sum_{k \neq 0} \Gamma \left(-1 - \frac{2\pi ik}{\ln 2}\right) e^{2\pi ik \ln N}
$$
Internal path length

Average case

\[ A_N = N \log N + N \left( \frac{\gamma - 1}{\ln 2} - \alpha + \frac{1}{2} + \delta(N) \right) + O \left( N^{1/2} \right) \]

External internal nodes

Definition

External internal nodes are nodes with both links null.
External internal nodes

Fundamental recurrence relation

\[ C_N = \sum_{k=0}^{\infty} \frac{1}{2^{N-1}} \binom{N-1}{k} (C_k + C_{N-1-k}), \quad N \geq 2 \]

with \( C_1 = 1 \) and \( C_0 = 0 \).
External internal nodes

Transformation

\[ C'(z) = \sum_{N=0}^{\infty} \frac{C_N z^N}{N!} \]

\[ C''(z) = 1 + 2C \left( \frac{z}{2} \right) e^{z^2/2} \]
External internal nodes

Substitution by $D(z) = e^{-z} C(z)$

$$D(z) = \sum_{N=0}^{\infty} \frac{D_N z^N}{N!}$$

$$D'(z) + D(z) = e^{-z} + 2D\left(\frac{z}{2}\right)$$
External internal nodes

Recurrence for \( D_N \)

\[
D_N + D_{N-1} = (-1)^{N-1} + \frac{1}{2^{N-2}} D_{N-1}
\]

\[
D_N = (-1)^{N-1} - \left(1 - \frac{1}{2^{N-2}}\right) D_{N-1}, \quad N \geq 2
\]

with \( D_1 = 1 \) and \( D_0 = 0 \)
External internal nodes

Introduction of $R_N$

$$R_N = Q_N \left( 1 + \sum_{k=1}^{N} \frac{1}{Q_k} \right)$$
External internal nodes

Explicit formula for $C'_N$

$$C'_N = N - \sum_{k=2}^{\infty} \binom{N}{k} (-1)^k R_{k-2}$$
External internal nodes

Simpler coefficients $R_N^*$

$$R_N^* = \frac{(N + 1 - \alpha) q^{N+1}}{1 - q^{N+1}} + \frac{1}{1 - q^{N+1}} R_{N+1}^*$$
External internal nodes

The meromorphic function \( R^* (z) \)

\[
R^* (z) = \sum_{i=2}^{\infty} \frac{(z + 1 + i - \alpha) q^{z+1+i}}{\prod_{j=0}^{i} (1 - q^{z+1+j})}
\]
External internal nodes

The meromorphic function $R^*(z)$
External internal nodes

Explicit formula for $C_N$

$$C_N = (N - 1)(\alpha + 1) - \sum_{k=2}^{\infty} \binom{N}{k} (-1)^k R_{k-2}^*$$
External internal nodes
Applying Rice’s method

\[ C_N - (N - 1)(\alpha + 1) = \frac{1}{2\pi i} \int_C B(N + 1, -z) R^*(z - 2) \, dz \]
External internal nodes

Approximation with Rectangle $R_{XY}$

$$C_N - (N - 1)(\alpha + 1) = \frac{1}{2\pi i} \int_{R_{XY}} B(N + 1, -z) R^*(z - 2) \, dz - \Delta$$
External internal nodes

Approximation of the integral

\[ O \left( \int_{-Y}^{Y} \frac{\Gamma(N+1)}{\Gamma(N + \frac{1}{2} - iy)} dy \right) = O \left( \int_{-Y}^{Y} N^{\frac{1}{2} - iy} dy \right) = O \left( N^{\frac{1}{2}} \right) \]
External internal nodes

Residue at $z = 1$

$$\Delta_{z=1} = N \left( \beta + 1 - \frac{1}{Q_\infty} \left( \alpha^2 - \alpha - \frac{1}{\ln{q}} \right) \right)$$
External internal nodes

Residues at $z = -1 \pm \frac{2\pi ik}{\ln q}$

$$\delta^* (N) = \frac{2\pi ik}{Q_\infty \ln q} \sum_{k \neq 0} \frac{1}{\ln q} \Gamma \left( -1 - \frac{2\pi ik}{\ln q} \right) e^{2\pi ik \lg N}$$
External internal nodes

Average case

\[ C_N = N \left( \beta + 1 - \frac{1}{Q_\infty} \left( \frac{1}{\ln 2} + \alpha^2 - \alpha \right) + \delta^* (N) \right) + O \left( N^{\frac{1}{2}} \right) \]

Digital search trie

A digital search trie is a digital tree for storing a set of strings in which there is one node for every prefix of every string in the set.
A Patricia tree is defined as a compact representation of a digital search trie where all nodes with one child are merged with their parent.

External path length for digital search trie

Fundamental recurrence relation

\[
A_N^{[T]} = N + \sum_{k=0}^{\infty} \frac{1}{2^N} \binom{N}{k} \left( A_k^{[T]} + A_{N-k}^{[T]} \right), \quad N \geq 2
\]

with \( A_0^{[T]} = A_1^{[T]} = 0 \)
External path length for digital search trie

Transformation

\[ A^T(\hat{z}) = z(e^z - 1) + 2A^T\left(\frac{\hat{z}}{2}\right)e^{z-2} \]
External path length for digital search trie

Substitution by $B(z)$

$$A(z) = e^z B(z)$$

$$B[T](z) = z \left(1 - e^{-z}\right) + 2B[T] \left(\frac{z}{2}\right)$$
External path length for digital search trie

Explicit formula

\[
B^{[T]} (z) = \frac{N \left( -1 \right)^N}{1 - \left( \frac{1}{2} \right)^{N-1}}
\]

\[
A^{[T]}_N = \sum_{k=2}^{\infty} \binom{N}{k} \frac{k \left( -1 \right)^k}{1 - \left( \frac{1}{2} \right)^{k-1}}
\]
External path length for digital search trie

average case

➤ General framework
General Framework for digital search trees

Fundamental recurrence relation

\[ X(T) = \sum_{\text{subtrees } T_j \text{ of the root of } T} X(T_j) + x(T) \]
General Framework for digital search trees

Transformation

\[ X(z) = \sum_{N=0}^{\infty} X_N \frac{z^N}{N!} \]

\[ X'(z) = MX \left( \frac{z}{M} \right) e^{(1 - \frac{1}{M})z} + x(z) \]
General Framework for digital search trees

Substitution

\[ Y(z) = e^{-z}X(z) \]
\[ y(z) = e^{-z}x(z) \]
\[ Y'(z) + Y(z) = MY\left(\frac{z}{M}\right) + y'(z) + y(z) \]
General Framework for digital search trees

Explicit formula

\[ X_N = \sum_{k=0}^{N} \binom{N}{k} Y_k \]
General Framework for digital search trees

Asymptotic analysis of \((-1)^k Y_k\)

Find a function \(Y_k^*\) which

(i) is simply related to \(Y_k\) so that \(\sum_{k=0}^{N} \binom{N}{k} \left( Y_k - (-1)^k Y_k^* \right)\) is easily evaluated,

(ii) satisfies a recurrence of the form
\[
Y_{N+1}^* = (1 - g(M, N)) Y_N^* + f(M, N),
\]

(iii) goes to zero quickly as \(N \to \infty\).
General Framework for digital search trees

Asymptotic analysis of \((-1)^k Y_k\)

Turn the recurrence around to extend $Y_N^*$ to the complex plane.
Evaluate $\sum_{k=0}^{N} \binom{N}{k} \left( Y_k - (-1)^k Y_k^* \right)$ as detailed in the previous sections.
General Framework for tries

\[ X(T) = \sum_{\text{subtrees } T_j \text{ of the root of } T} X(T_j) + x(T) \]

\[ X(z) = MX \left( \frac{z}{M} \right) e^{\frac{z}{M}} + x(z) \]

This can be solved by Rice’s method or also by Mellin transform techniques.
Thank you for your attention!
