4 Modelling Issues

How do you measure?

- Implementing and testing on representative inputs
 - How do you choose your inputs?
 - May be very time-consuming.
 - Very reliable results if done correctly.
 - Results only hold for a specific machine and for a specific set of inputs.
- Theoretical analysis in a specific model of computation.
 - Gives asymptotic bounds like "this algorithm always runs in time $\mathcal{O}(n^2)$ ".
 - Typically focuses on the worst case.
 - Can give lower bounds like "any comparison-based sorting algorithm needs at least Ω(n log n) comparisons in the worst case".

Ernst Mayr, Harald Räcke

4 Modelling Issues

Input length

The theoretical bounds are usually given by a function $f : \mathbb{N} \to \mathbb{N}$ that maps the input length to the running time (or storage space, comparisons, multiplications, program size etc.).

The input length may e.g. be

- the size of the input (number of bits)
- the number of arguments

Example 1

Suppose *n* numbers from the interval $\{1, ..., N\}$ have to be sorted. In this case we usually say that the input length is *n* instead of e.g. $n \log N$, which would be the number of bits required to encode the input.

```

19. Oct. 2021 6/106

Turing Machine

- Very simple model of computation.
- Only the "current" memory location can be altered.
- Very good model for discussing computabiliy, or polynomial vs. exponential time.
- Some simple problems like recognizing whether input is of the form xx, where x is a string, have quadratic lower bound.
- \Rightarrow Not a good model for developing efficient algorithms.

Model of Computation

How to measure performance

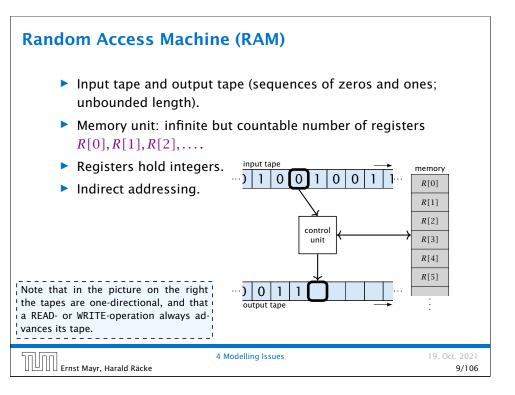

- Calculate running time and storage space etc. on a simplified, idealized model of computation, e.g. Random Access Machine (RAM), Turing Machine (TM), ...
- 2. Calculate number of certain basic operations: comparisons, multiplications, harddisc accesses, ...

Version 2. is often easier, but focusing on one type of operation makes it more difficult to obtain meaningful results.

Ernst Mayr, Harald Räcke

4 Modelling Issues

19. Oct. 2021 7/106

Random Access Machine (RAM)

Operations

- input operations (input tape $\rightarrow R[i]$)
 - ► READ *i*
- output operations $(R[i] \rightarrow \text{output tape})$
 - ▶ WRITE *i*
- register-register transfers
 - \triangleright R[j] := R[i]
 - \triangleright R[i] := 4
- indirect addressing
 - \triangleright R[i] := R[R[i]]

loads the content of the R[i]-th register into the *j*-th register

4 Modelling Issues

```
Model of Computation
      uniform cost model
         Every operation takes time 1.
      logarithmic cost model
         The cost depends on the content of memory cells:
            The time for a step is equal to the largest operand involved;
            The storage space of a register is equal to the length (in bits)
              of the largest value ever stored in it.
    Bounded word RAM model: cost is uniform but the largest value
    stored in a register may not exceed 2^w, where usually w = \log_2 n.
                The latter model is quite realistic as the word-size of
                 a standard computer that handles a problem of size n
                 must be at least \log_2 n as otherwise the computer could
                 either not store the problem instance or not address all !
                its memory.
                                  4 Modelling Issues

4 Modelling Issues	19. Oct. 2021 13/106

There are different types of complexity bounds:

best-case complexity:

 $C_{\rm bc}(n) := \min\{C(x) \mid |x| = n\}$

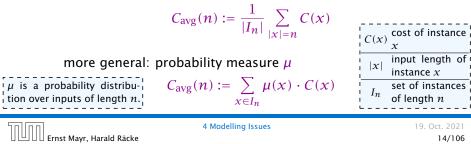

Usually easy to analyze, but not very meaningful.

worst-case complexity:

 $C_{wc}(n) := \max\{C(x) \mid |x| = n\}$

Usually moderately easy to analyze; sometimes too pessimistic.

average case complexity:

14/106

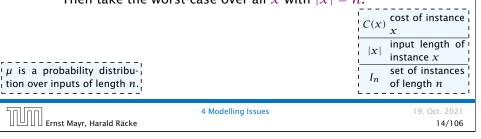

There are different types of complexity bounds:

amortized complexity:

The average cost of data structure operations over a worst case sequence of operations.

randomized complexity:

The algorithm may use random bits. Expected running time (over all possible choices of random bits) for a fixed input x. Then take the worst-case over all x with |x| = n.

5 Asymptotic Notation

We are usually not interested in exact running times, but only in an asymptotic classification of the running time, that ignores constant factors and constant additive offsets.

- We are usually interested in the running times for large values of n. Then constant additive terms do not play an important role.
- An exact analysis (e.g. exactly counting the number of operations in a RAM) may be hard, but wouldn't lead to more precise results as the computational model is already guite a distance from reality.
- A linear speed-up (i.e., by a constant factor) is always possible by e.g. implementing the algorithm on a faster machine.
- Running time should be expressed by simple functions.

Asymptotic Notation

Formal Definition

Let f, g denote functions from \mathbb{N} to \mathbb{R}^+ .

- $\mathcal{O}(f) = \{g \mid \exists c > 0 \ \exists n_0 \in \mathbb{N}_0 \ \forall n \ge n_0 : [g(n) \le c \cdot f(n)]\}$ (set of functions that asymptotically grow not faster than f)
- $\Omega(f) = \{g \mid \exists c > 0 \ \exists n_0 \in \mathbb{N}_0 \ \forall n \ge n_0 : [g(n) \ge c \cdot f(n)]\}$ (set of functions that asymptotically grow not slower than f)
- $\Theta(f) = \Omega(f) \cap \mathcal{O}(f)$ (functions that asymptotically have the same growth as f)
- ▶ $o(f) = \{g \mid \forall c > 0 \exists n_0 \in \mathbb{N}_0 \forall n \ge n_0 : [g(n) \le c \cdot f(n)]\}$ (set of functions that asymptotically grow slower than f)
- ► $\omega(f) = \{g \mid \forall c > 0 \exists n_0 \in \mathbb{N}_0 \forall n \ge n_0 : [g(n) \ge c \cdot f(n)]\}$ (set of functions that asymptotically grow faster than f)

[חח] [חר]	5 Asymptotic Notation	19. Oct. 2021
🛛 🕒 🛛 🖉 Ernst Mayr, Harald Räcke		16/106

Asymptotic Notation

Abuse of notation

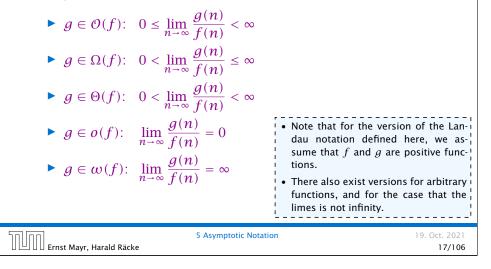

- 1. People write f = O(g), when they mean $f \in O(g)$. This is **not** an equality (how could a function be equal to a set of functions).
- **2.** People write $f(n) = \mathcal{O}(g(n))$, when they mean $f \in \mathcal{O}(g)$, with $f : \mathbb{N} \to \mathbb{R}^+, n \mapsto f(n)$, and $g : \mathbb{N} \to \mathbb{R}^+, n \mapsto g(n)$.
- **3.** People write e.g. h(n) = f(n) + o(g(n)) when they mean that there exists a function $z : \mathbb{N} \to \mathbb{R}^+, n \mapsto z(n), z \in o(g)$ such that h(n) = f(n) + z(n).

2. In this context f(n) does **not** mean the function f evaluated at n, but instead it is a shorthand for the function itself (leaving out domain and codomain and only giving the rule of correspondence of the function).

3. This is particularly useful if you do not want to ignore constant factors. For example the median of n elements can be determined using $\frac{3}{2}n + o(n)$ comparisons.

Asymptotic Notation

There is an equivalent definition using limes notation (assuming that the respective limes exists). f and g are functions from \mathbb{N}_0 to \mathbb{R}_0^+ .

Asymptotic Notation Abuse of notation 4. People write O(f(n)) = O(g(n)), when they mean $O(f(n)) \subseteq O(g(n))$. Again this is not an equality. 2. In this context f(n) does not mean the function f evaluated at n, but instead it is a shorthand for the function itself (leaving out domain and codomain and only giving the rule of correspondence of the function). 3. This is particularly useful if you do not want to ignore constant factors. For example the median of n elements can be determined using $\frac{3}{2}n + o(n)$ comparisons.

Asymptotic Notation in Equations

How do we interpret an expression like:

$$2n^2 + 3n + 1 = 2n^2 + \Theta(n)$$

Here, $\Theta(n)$ stands for an anonymous function in the set $\Theta(n)$ that makes the expression true.

Note that $\Theta(n)$ is on the right hand side, otw. this interpretation is wrong.

Notation

Ernst Mayr, Harald Räcke	5 Asymptotic

	,
and the second	The $\Theta(i)$ -symbol on the left rep-
Asymptotic Notation in Equations	resents one anonymous function

How do we interpret an expression like:

$$\sum_{i=1}^n \Theta(i) = \Theta(n^2)$$

Careful!

"It is understood" that every occurrence of an \mathcal{O} -symbol (or $(\Theta, \Omega, o, \omega)$ on the left represents one anonymous function.

Hence, the left side is **not** equal to

$$\Theta(1) + \Theta(2) + \cdots + \Theta(n-1) + \Theta(n)$$

 $\Theta(1) + \Theta(2) + \cdots + \Theta(n-1) + \Theta(n)$ does not really have a reasonable interpreta-

19. Oct. 2021

5 Asymptotic Notation Ernst Mayr, Harald Räcke

Asymptotic Notation in Equations

How do we interpret an expression like:

 $2n^2 + \mathcal{O}(n) = \Theta(n^2)$

Regardless of how we choose the anonymous function $f(n) \in \mathcal{O}(n)$ there is an anonymous function $g(n) \in \Theta(n^2)$ that makes the expression true.

Ernst Mayr, Harald Räcke

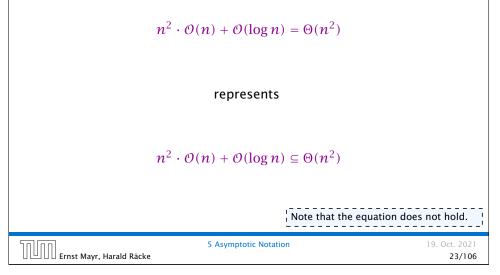

5 Asymptotic Notation

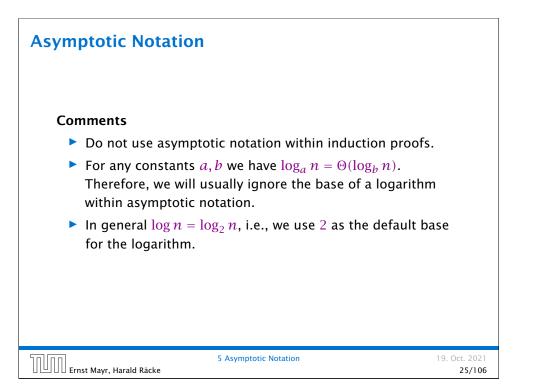

19. Oct. 2021 20/106

Asymptotic Notation in Equations

Then an asymptotic equation can be interpreted as containement btw. two sets:

Asymptotic Notation

Lemma 3

Let f, g be functions with the property $\exists n_0 > 0 \ \forall n \ge n_0 : f(n) > 0$ (the same for g). Then

- $c \cdot f(n) \in \Theta(f(n))$ for any constant c
- $\mathcal{O}(f(n)) + \mathcal{O}(g(n)) = \mathcal{O}(f(n) + g(n))$
- $\mathcal{O}(f(n)) \cdot \mathcal{O}(g(n)) = \mathcal{O}(f(n) \cdot g(n))$
- $\mathcal{O}(f(n)) + \mathcal{O}(g(n)) = \mathcal{O}(\max\{f(n), g(n)\})$

The expressions also hold for Ω . Note that this means that $f(n) + g(n) \in \Theta(\max\{f(n), g(n)\})$.

 5 Asymptotic Notation
 19. Oct. 2021

 Ernst Mayr, Harald Räcke
 24/106

Asymptotic Notation

In general asymptotic classification of running times is a good measure for comparing algorithms:

- If the running time analysis is tight and actually occurs in practise (i.e., the asymptotic bound is not a purely theoretical worst-case bound), then the algorithm that has better asymptotic running time will always outperform a weaker algorithm for large enough values of n.
- However, suppose that I have two algorithms:
 - Algorithm A. Running time $f(n) = 1000 \log n = O(\log n)$.
 - Algorithm B. Running time $g(n) = \log^2 n$.

Clearly f = o(g). However, as long as $\log n \le 1000$ Algorithm B will be more efficient.

Multiple Variables in Asymptotic Notation

Sometimes the input for an algorithm consists of several parameters (e.g., nodes and edges of a graph (n and m)).

If we want to make asympotic statements for $n \rightarrow \infty$ and $m \rightarrow \infty$ we have to extend the definition to multiple variables.

Formal Definition

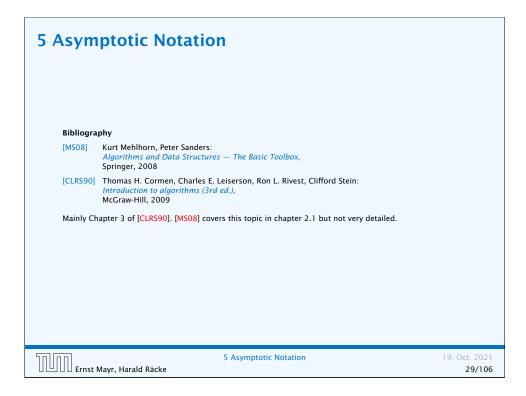

Let f, g denote functions from \mathbb{N}^d to \mathbb{R}_0^+ .

• $\mathcal{O}(f) = \{g \mid \exists c > 0 \exists N \in \mathbb{N}_0 \forall \vec{n} \text{ with } n_i \ge N \text{ for some } i : [g(\vec{n}) \le c \cdot f(\vec{n})]\}$

(set of functions that asymptotically grow not faster than f)

19. Oct. 2021 27/106

Ernst Mayr, Harald Räcke	5 Asymptotic Notation	

Multiple Variables in Asymptotic Notation

Example 4

- ▶ $f : \mathbb{N} \to \mathbb{R}_0^+$, f(n, m) = 1 und $g : \mathbb{N} \to \mathbb{R}_0^+$, g(n, m) = n 1then $f = \mathcal{O}(g)$ does not hold
- ► $f : \mathbb{N} \to \mathbb{R}_0^+$, f(n, m) = 1 und $g : \mathbb{N} \to \mathbb{R}_0^+$, g(n, m) = nthen: $f = \mathcal{O}(g)$
- $f: \mathbb{N}_0 \to \mathbb{R}_0^+$, f(n, m) = 1 und $g: \mathbb{N}_0 \to \mathbb{R}_0^+$, g(n, m) = nthen $f = \mathcal{O}(g)$ does not hold

comparisons when n > 1 and 0 comparisons when $n \le 1$.

Ernst Mayr, Harald Räcke

Recurrences

How do we bring the expression for the number of comparisons (\approx running time) into a closed form?

For this we need to solve the recurrence.

Ernst Mayr, Harald Räcke

6 Recurrences

Methods for Solving Recurrences A cenerating Functions A more general technique that allows to solve certain types of linear inhomogenous relations and also sometimes non-linear recurrence relations. Transformation of the Recurrence Sometimes one can transform the given recurrence relations so that it e.g. becomes linear and can therefore be solved with one of the other techniques.

Methods for Solving Recurrences

1. Guessing+Induction

Guess the right solution and prove that it is correct via induction. It needs experience to make the right guess.

2. Master Theorem

For a lot of recurrences that appear in the analysis of algorithms this theorem can be used to obtain tight asymptotic bounds. It does not provide exact solutions.

3. Characteristic Polynomial

Linear homogenous recurrences can be solved via this method.

Ernst Mayr, Harald Räcke

6 Recurrences

19. Oct. 2021 31/106

6.1 Guessing+Induction First we need to get rid of the \mathcal{O} -notation in our recurrence: $T(n) \leq \begin{cases} 2T(\lceil \frac{n}{2} \rceil) + cn & n \geq 2\\ 0 & \text{otherwise} \end{cases}$ Informal way: Assume that instead we have $T(n) \leq \begin{cases} 2T(\frac{n}{2}) + cn & n \geq 2\\ 0 & \text{otherwise} \end{cases}$

One way of solving such a recurrence is to guess a solution, and check that it is correct by plugging it in.

UUU Ernst Mayr, Harald Räcke

19. Oct. 2021 32/106

19. Oct. 2021

30/106

6.1 Guessing+Induction

Suppose we guess $T(n) \le dn \log n$ for a constant *d*. Then

$$T(n) \le 2T\left(\frac{n}{2}\right) + cn$$
$$\le 2\left(d\frac{n}{2}\log\frac{n}{2}\right) + cn$$
$$= dn(\log n - 1) + cn$$
$$= dn\log n + (c - d)n$$
$$\le dn\log n$$

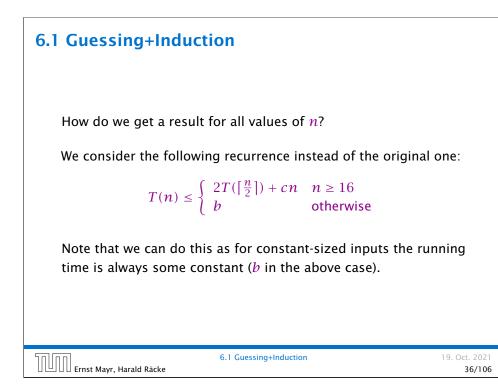

if we choose $d \ge c$.

Formally, this is not correct if n is not a power of 2. Also even in this case one would need to do an induction proof.

Ernst Mayr, Harald Räcke	6.1 Gu
🛛 🕒 🛛 🖉 Ernst Mayr, Harald Räcke	

```
essing+Induction
```

19. Oct. 2021 34/106

6.1 Guessing+Induction

 $2T\left(\frac{n}{2}\right) + cn \quad n \ge 16$ $T(n) \leq \frac{1}{2}$ otw.

37/106

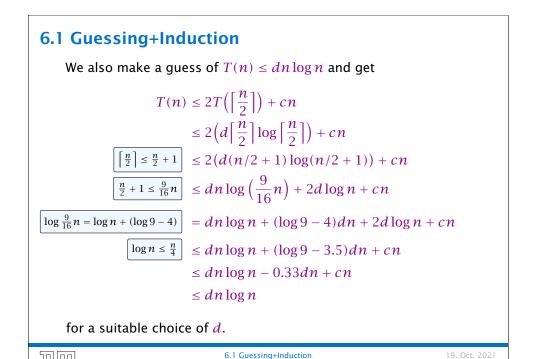

Guess: $T(n) \le dn \log n$. **Proof.** (by induction)

- **base case** $(2 \le n < 16)$: true if we choose $d \ge b$.
- induction step $n/2 \rightarrow n$:

Let $n = 2^k \ge 16$. Suppose statem. is true for n' = n/2. We prove it for n:

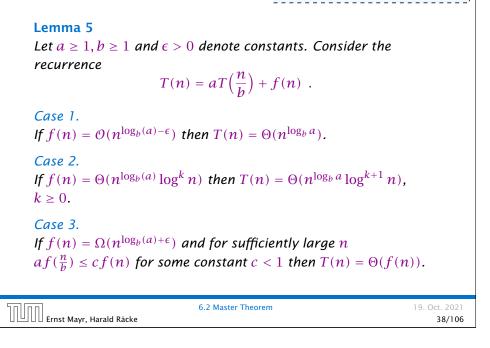

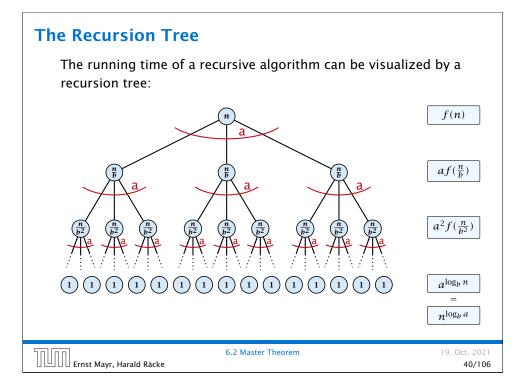

Hence, statement is true if we choose $d \ge c$.

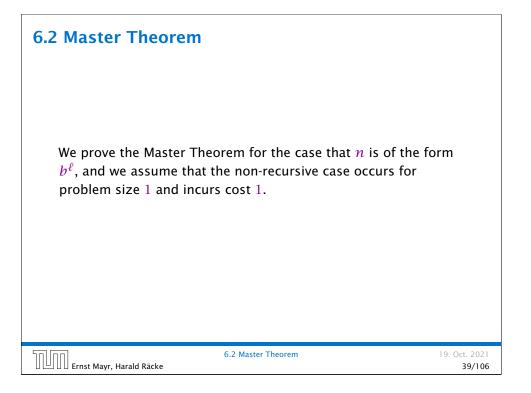

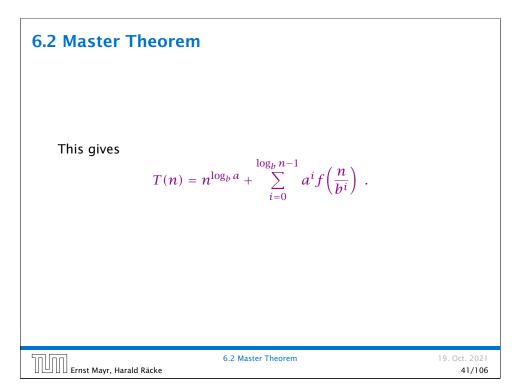

6.2 Master Theorem

Note that the cases do not cover all possibilities.

Case 1. Now suppose that
$$f(n) \leq c n^{\log_b a - \epsilon}$$
.

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n-1} a^i f\left(\frac{n}{b^i}\right)$$

$$\leq c \sum_{i=0}^{\log_b n-1} a^i \left(\frac{n}{b^i}\right)^{\log_b a - \epsilon}$$

$$\frac{b^{-i(\log_b a - \epsilon)} = b^{\epsilon i} (b^{\log_b a})^{-i} = b^{\epsilon i} a^{-i}}{\sum_{i=0}^{k-1}} = c n^{\log_b a - \epsilon} \sum_{i=0}^{\log_b n-1} (b^{\epsilon})^i$$

$$\frac{\sum_{i=0}^k q^i = \frac{q^{k+1}-1}{q-1}}{\sum_{i=0}^k (n^{\epsilon} - 1)/(b^{\epsilon} - 1)} = c n^{\log_b a - \epsilon} (n^{\epsilon} - 1)/(b^{\epsilon} - 1)$$

$$= \frac{c}{b^{\epsilon} - 1} n^{\log_b a} (n^{\epsilon} - 1)/(n^{\epsilon})$$
Hence,

$$T(n) \leq \left(\frac{c}{b^{\epsilon} - 1} + 1\right) n^{\log_b (a)} \qquad \Rightarrow T(n) = \mathcal{O}(n^{\log_b a}).$$

Case 2. Now suppose that
$$f(n) \ge c n^{\log_b a}$$
.

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n-1} a^i f\left(\frac{n}{b^i}\right)$$

$$\ge c \sum_{i=0}^{\log_b n-1} a^i \left(\frac{n}{b^i}\right)^{\log_b a}$$

$$= c n^{\log_b a} \sum_{i=0}^{\log_b n-1} 1$$

$$= c n^{\log_b a} \log_b n$$
Hence,

$$T(n) = \Omega(n^{\log_b a} \log_b n) \qquad \Rightarrow T(n) = \Omega(n^{\log_b a} \log n).$$

Case 2. Now suppose that
$$f(n) \leq c n^{\log_b a}$$
.

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n-1} a^i f\left(\frac{n}{b^i}\right)$$

$$\leq c \sum_{i=0}^{\log_b n-1} a^i \left(\frac{n}{b^i}\right)^{\log_b a}$$

$$= c n^{\log_b a} \sum_{i=0}^{\log_b n-1} 1$$

$$= c n^{\log_b a} \log_b n$$
Hence,

$$T(n) = \mathcal{O}(n^{\log_b a} \log_b n) \quad \Rightarrow T(n) = \mathcal{O}(n^{\log_b a} \log n).$$

Case 2. Now suppose that
$$f(n) \leq c n^{\log_b a} (\log_b(n))^k$$
.

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n-1} a^i f\left(\frac{n}{b^i}\right)$$

$$\leq c \sum_{i=0}^{\log_b n-1} a^i \left(\frac{n}{b^i}\right)^{\log_b a} \cdot \left(\log_b \left(\frac{n}{b^i}\right)\right)^k$$

$$n = b^\ell \Rightarrow \ell = \log_b n = c n^{\log_b a} \sum_{i=0}^{\ell-1} \left(\log_b \left(\frac{b^\ell}{b^i}\right)\right)^k$$

$$= c n^{\log_b a} \sum_{i=0}^{\ell-1} (\ell - i)^k$$

$$= c n^{\log_b a} \sum_{i=1}^{\ell} i^k = \frac{1}{k} \ell^{k+1}$$

$$\approx \frac{c}{k} n^{\log_b a} \ell^{k+1} \qquad \Rightarrow T(n) = \mathcal{O}(n^{\log_b a} \log^{k+1} n).$$

Case 3. Now suppose that $f(n) \ge dn^{\log_b a + \epsilon}$, and that for sufficiently large n: $af(n/b) \le cf(n)$, for c < 1.

From this we get $a^i f(n/b^i) \le c^i f(n)$, where we assume that $n/b^{i-1} \ge n_0$ is still sufficiently large.

$$T(n) - n^{\log_{b} a} = \sum_{i=0}^{\log_{b} n-1} a^{i} f\left(\frac{n}{b^{i}}\right)$$

$$\leq \sum_{i=0}^{\log_{b} n-1} c^{i} f(n) + \mathcal{O}(n^{\log_{b} a})$$

$$q < 1: \sum_{i=0}^{n} q^{i} = \frac{1-q^{n+1}}{1-q} \leq \frac{1}{1-q} \qquad \leq \frac{1}{1-c} f(n) + \mathcal{O}(n^{\log_{b} a})$$
Hence,
$$T(n) \leq \mathcal{O}(f(n)) \qquad \Rightarrow T(n) = \Theta(f(n)).$$
Where did we use $f(n) \geq \Omega(n^{\log_{b} a+\epsilon})$?

6.2 Master Theorem

Example: Multiplying Two IntegersSuppose that we want to multiply an *n*-bit integer *A* and an *m*-bit integer *B* ($m \le n$). $1 \ 0 \ 0 \ 0 \ 1 \times 1 \ 0 \ 1 \ 1$ $1 \ 0 \ 0 \ 0 \ 1 \times 1 \ 0 \ 1 \ 1$ $1 \ 0 \ 0 \ 0 \ 1 \times 1 \ 0 \ 1 \ 1$ $1 \ 0 \ 0 \ 0 \ 1 \times 1 \ 0 \ 1 \ 0$ • This is also nown as the "school method" for multiplying integers.• Note that the intermediate numbers that are generated can have at most $m + n \le 2n$ bits. $1 \ 0 \ 1 \ 1 \ 0 \ 0 \ 0$ $1 \ 0 \ 1 \ 1 \ 0 \ 1 \ 1$ Time requirement:

- Computing intermediate results: O(nm).
- Adding *m* numbers of length $\leq 2n$: $\mathcal{O}((m+n)m) = \mathcal{O}(nm)$.

Ernst Mayr, Harald Räcke

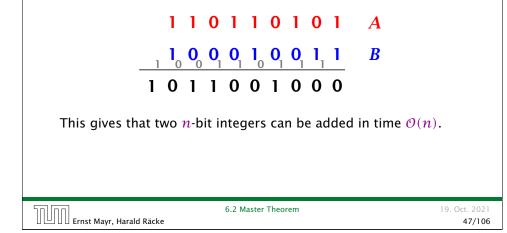

Ernst Mayr. Harald Räcke

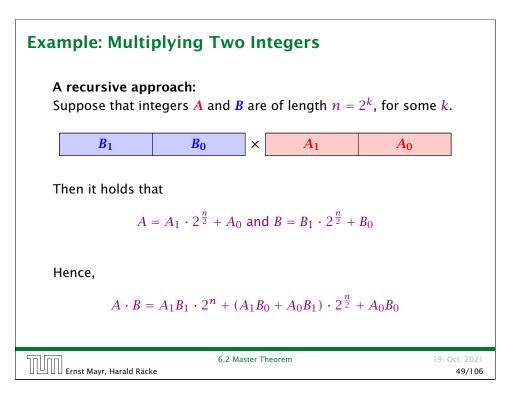

6.2 Master Theorem

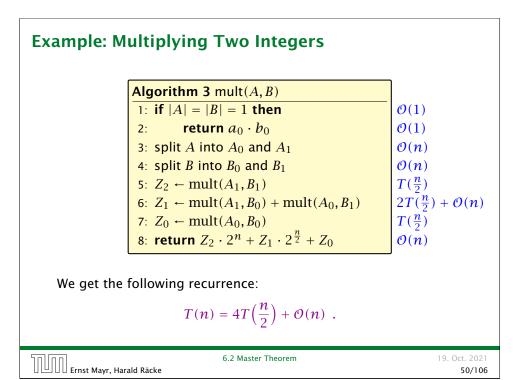

Example: Multiplying Two Integers

Suppose we want to multiply two n-bit Integers, but our registers can only perform operations on integers of constant size.

For this we first need to be able to add two integers **A** and **B**:

We can use the following identity to compute Z_1 : $Z_1 = A_1B_0 + A_0B_1 = Z_2 = Z_0$ $= (A_0 + A_1) \cdot (B_0 + B_1) - A_1B_1 - A_0B_0$ Hence, Hence, $Algorithm 4 \operatorname{mult}(A, B)$ 1: if $ A = B = 1$ then 2: return $a_0 \cdot b_0$ $\mathcal{O}(1)$	
Hence, $ \frac{\text{Algorithm 4 mult}(A, B)}{1: \text{ if } A = B = 1 \text{ then}} \mathcal{O}(1) $	
Hence, $ \frac{\text{Algorithm 4 mult}(A, B)}{1: \text{ if } A = B = 1 \text{ then}} \mathcal{O}(1) $	
Algorithm 4 mult(A, B)1: if $ A = B = 1$ then $\mathcal{O}(1)$	
1: if $ A = B = 1$ then $O(1)$	
2: return $a_0 \cdot b_0$ $\mathcal{O}(1)$	
3: split A into A_0 and A_1 $\mathcal{O}(n)$	
4: split <i>B</i> into B_0 and B_1 $\mathcal{O}(n)$	
A more precise 5: $Z_2 \leftarrow \text{mult}(A_1, B_1)$ $T(\frac{n}{2})$	
(correct) analysis $\begin{bmatrix} 6 \\ 2 \\ 6 \end{bmatrix} \leftarrow \text{mult}(A_0, B_0)$ $T(\frac{n}{2})$	
would say that computing Z_1 is $Z_1 \leftarrow \text{mult}(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$ $T(\frac{\tilde{n}}{2}) + \mathcal{O}(n)$	
8: return $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$ $\mathcal{O}(n)$	
6.2 Master Theorem 19. Oct. 202 Ernst Mayr, Harald Räcke 52/10	

Example: Multiplying Two Integers

Master Theorem: Recurrence: $T[n] = aT(\frac{n}{h}) + f(n)$.

- Case 1: $f(n) = O(n^{\log_b a \epsilon})$ $T(n) = O(n^{\log_b a})$
- Case 2: $f(n) = \Theta(n^{\log_b a} \log^k n)$ $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- Case 3: $f(n) = \Omega(n^{\log_b a + \epsilon})$ $T(n) = \Theta(f(n))$

In our case a = 4, b = 2, and $f(n) = \Theta(n)$. Hence, we are in Case 1, since $n = O(n^{2-\epsilon}) = O(n^{\log_b a - \epsilon})$.

We get a running time of $\mathcal{O}(n^2)$ for our algorithm.

- \Rightarrow Not better then the "school method".
- 6.2 Master Theorem
 19. Oct. 2021

 Ernst Mayr, Harald Räcke
 51/106

	-	-	
We get the following r	ecurrence:		
Т	$(n) = 3T\left(\frac{n}{2}\right) +$	$+ \mathcal{O}(n)$.	
Master Theorem: Rec	urrence: <i>T</i> [<i>n</i>]	$= aT(\frac{n}{b}) + f(n).$	
• Case 1: $f(n) = \mathcal{O}$	$(n^{\log_b a-\epsilon})$	$T(n) = \Theta(n^{\log_b a})$	
• Case 2: $f(n) = \Theta$	$(n^{\log_b a} \log^k n)$	$T(n) = \Theta(n^{\log_b a} \log$	$\log^{k+1} n$)
• Case 3: $f(n) = \Omega$	$2(n^{\log_b a+\epsilon})$	$T(n) = \Theta(f(n))$	
Again we are in Case 1 $\Theta(n^{\log_2 3}) \approx \Theta(n^{1.59}).$	I . We get a run	ning time of	
A huge improvement of	over the "schoo	ol method".

6.3 The Characteristic Polynomial

Consider the recurrence relation:

```
c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)
```

This is the general form of a linear recurrence relation of order k with constant coefficients ($c_0, c_k \neq 0$).

- T(n) only depends on the k preceding values. This means the recurrence relation is of order k.
- The recurrence is linear as there are no products of T[n]'s.
- If f(n) = 0 then the recurrence relation becomes a linear, homogenous recurrence relation of order k.

Note that we ignore boundary conditions for the moment.

Ernst Mayr, Harald Räcke	6.3 The Characteristic Polynomial
	Ernst Mayr, Harald Räcke

The Homogenous Case

The solution space

 $S = \left\{ \mathcal{T} = T[1], T[2], T[3], \dots \mid \mathcal{T} \text{ fulfills recurrence relation} \right\}$

is a vector space. This means that if $\mathcal{T}_1, \mathcal{T}_2 \in S$, then also $\alpha \mathcal{T}_1 + \beta \mathcal{T}_2 \in S$, for arbitrary constants α, β .

How do we find a non-trivial solution?

We guess that the solution is of the form λ^n , $\lambda \neq 0$, and see what happens. In order for this guess to fulfill the recurrence we need

$$c_0\lambda^n + c_1\lambda^{n-1} + c_2 \cdot \lambda^{n-2} + \dots + c_k \cdot \lambda^{n-k} = 0$$

for all $n \ge k$.

```
Ernst Mayr, Harald Räcke
```

19. Oct. 2021 56/106

19. Oct. 2021 54/106

6.3 The Characteristic Polynomial

Observations:

- The solution T[1], T[2], T[3],... is completely determined by a set of boundary conditions that specify values for T[1],...,T[k].
- In fact, any k consecutive values completely determine the solution.
- k non-concecutive values might not be an appropriate set of boundary conditions (depends on the problem).

Approach:

- First determine all solutions that satisfy recurrence relation.
- > Then pick the right one by analyzing boundary conditions.
- First consider the homogenous case.

🛛 💾 🔲 Ernst Mayr, Harald Räcke		55/106

The Homogenous Case

Dividing by λ^{n-k} gives that all these constraints are identical to

$$\underbrace{c_0\lambda^k + c_1\lambda^{k-1} + c_2 \cdot \lambda^{k-2} + \dots + c_k}_{\text{characteristic polynomial } P[\lambda]} = 0$$

This means that if λ_i is a root (Nullstelle) of $P[\lambda]$ then $T[n] = \lambda_i^n$ is a solution to the recurrence relation.

Let $\lambda_1, \ldots, \lambda_k$ be the k (complex) roots of $P[\lambda]$. Then, because of the vector space property

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$

is a solution for arbitrary values α_i .

The Homogenous Case

Lemma 6

Assume that the characteristic polynomial has k distinct roots $\lambda_1, \ldots, \lambda_k$. Then all solutions to the recurrence relation are of the form

 $\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$.

Proof.

There is one solution for every possible choice of boundary conditions for $T[1], \ldots, T[k]$.

We show that the above set of solutions contains one solution for every choice of boundary conditions.

Ernst Mayr, Harald Räcke	6.3 The Characte
🛛 🕒 🛛 🖉 Ernst Mayr, Harald Räcke	

The Characteristic Polynomial

The Homogenous Case

Proof (cont.).

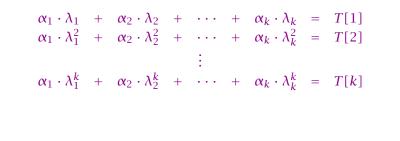

Suppose I am given boundary conditions T[i] and I want to see whether I can choose the $\alpha'_i s$ such that these conditions are met:

$$\begin{pmatrix} \lambda_1 & \lambda_2 & \cdots & \lambda_k \\ \lambda_1^2 & \lambda_2^2 & \cdots & \lambda_k^2 \\ & \vdots & & \\ \lambda_1^k & \lambda_2^k & \cdots & \lambda_k^k \end{pmatrix} \begin{pmatrix} \alpha_1 \\ \alpha_2 \\ \vdots \\ \alpha_k \end{pmatrix} = \begin{pmatrix} T[1] \\ T[2] \\ \vdots \\ T[k] \end{pmatrix}$$

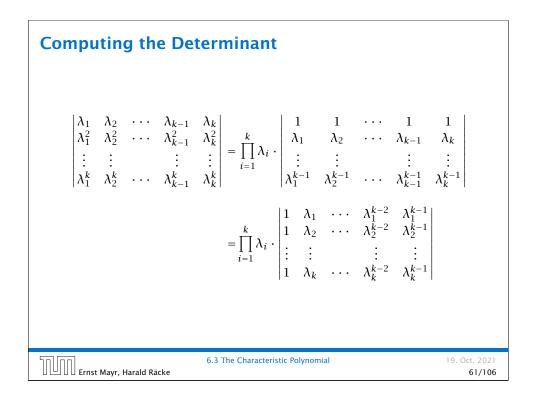

We show that the column vectors are linearly independent. Then the above equation has a solution. The Homogenous Case

Proof (cont.).

Suppose I am given boundary conditions T[i] and I want to see whether I can choose the $\alpha'_i s$ such that these conditions are met:

19. Oct. 2021

19. Oct. 2021 58/106

The Homogeneous Case

What happens if the roots are not all distinct?

Suppose we have a root λ_i with multiplicity (Vielfachheit) at least 2. Then not only is λ_i^n a solution to the recurrence but also $n\lambda_i^n$.

To see this consider the polynomial

 $P[\lambda] \cdot \lambda^{n-k} = c_0 \lambda^n + c_1 \lambda^{n-1} + c_2 \lambda^{n-2} + \dots + c_k \lambda^{n-k}$

Since λ_i is a root we can write this as $Q[\lambda] \cdot (\lambda - \lambda_i)^2$. Calculating the derivative gives a polynomial that still has root λ_i .

Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

The Homogeneous Case

Suppose λ_i has multiplicity *j*. We know that

 $c_0 n \lambda_i^n + c_1 (n-1) \lambda_i^{n-1} + \dots + c_k (n-k) \lambda_i^{n-k} = 0$

(after taking the derivative; multiplying with λ ; plugging in λ_i)

Doing this again gives

$$c_0 n^2 \lambda_i^n + c_1 (n-1)^2 \lambda_i^{n-1} + \dots + c_k (n-k)^2 \lambda_i^{n-k} = 0$$

We can continue j - 1 times.

```
Hence, n^{\ell}\lambda_i^n is a solution for \ell \in 0, ..., j-1.
```

הח ה	Ernst Mayr, H		
	Ernst Mayr, H	Harald	Räcke

6.3 The Characteristic Polynomial

19. Oct. 2021 68/106

19. Oct. 2021 66/106

This means $c_0n\lambda_i^{n-1}+c_1(n-1)\lambda_i^{n-2}+\cdots+c_k(n-k)\lambda_i^{n-k-1}=0$ Hence,

$$c_0 \underbrace{n\lambda_i^n}_{T[n]} + c_1 \underbrace{(n-1)\lambda_i^{n-1}}_{T[n-1]} + \cdots + c_k \underbrace{(n-k)\lambda_i^{n-k}}_{T[n-k]} = 0$$

The Homogeneous Case

Lemma 7

Let $P[\lambda]$ denote the characteristic polynomial to the recurrence

 $c_0T[n] + c_1T[n-1] + \cdots + c_kT[n-k] = 0$

Let λ_i , i = 1, ..., m be the (complex) roots of $P[\lambda]$ with multiplicities ℓ_i . Then the general solution to the recurrence is given by

$$T[n] = \sum_{i=1}^{m} \sum_{j=0}^{\ell_i-1} \alpha_{ij} \cdot (n^j \lambda_i^n) .$$

The full proof is omitted. We have only shown that any choice of α_{ij} 's is a solution to the recurrence.

Ernst Mayr, Harald Räcke

Example: Fibonacci Sequence

T[0] = 0 T[1] = 1T[n] = T[n-1] + T[n-2] for $n \ge 2$

The characteristic polynomial is

 $\lambda^2 - \lambda - 1$

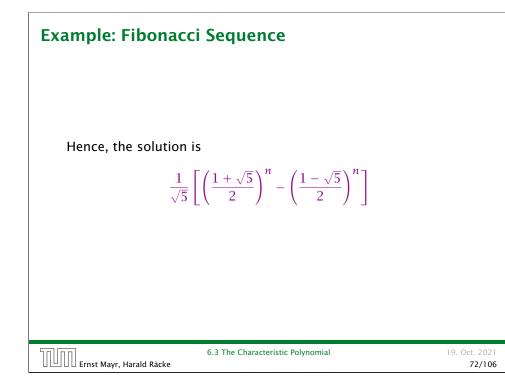

Finding the roots, gives

$$\lambda_{1/2} = \frac{1}{2} \pm \sqrt{\frac{1}{4} + 1} = \frac{1}{2} \left(1 \pm \sqrt{5} \right)$$

Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

19. Oct. 2021 70/106

Example: Fibonacci Sequence

Hence, the solution is of the form

α	$\left(\frac{1+\sqrt{5}}{2}\right)$	$n + \beta$	$\left(\frac{1-\sqrt{5}}{2}\right)$	$\Big)^n$
	(2)	,	2)

T[0] = 0 gives $\alpha + \beta = 0$.

T[1] = 1 gives

$$\alpha\left(\frac{1+\sqrt{5}}{2}\right)+\beta\left(\frac{1-\sqrt{5}}{2}\right)=1 \Longrightarrow \alpha-\beta=\frac{2}{\sqrt{5}}$$

החוחר	6.3 The Characteristic Polynomial	19. Oct. 2021
UUU Ernst Mayr, Harald Räcke		71/106

Consider the recurrence relation: $c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$ with $f(n) \neq 0$.
$c_0T(n) + c_1T(n-1) + c_2T(n-2) + \dots + c_kT(n-k) = f(n)$
with $f(n) \neq 0$
with $f(n) \neq 0$.
While we have a fairly general technique for solving homogeneous linear recurrence relations the inhomogeneous case is different.

The Inhomogeneous Case

The general solution of the recurrence relation is

 $T(n) = T_h(n) + T_p(n) ,$

where T_h is any solution to the homogeneous equation, and T_p is one particular solution to the inhomogeneous equation.

There is no general method to find a particular solution.

6.3 The Characteristic Polynomial Ernst Mayr, Harald Räcke

The Inhomogeneous Case

Example: Characteristic polynomial:

 $\underbrace{\lambda^2 - 2\lambda + 1}_{(\lambda - 1)^2} = 0$

Then the solution is of the form

$$T[n] = \alpha 1^n + \beta n 1^n = \alpha + \beta n$$

T[0] = 1 gives $\alpha = 1$.

Ernst Mayr, Harald Räcke

T[1] = 2 gives $1 + \beta = 2 \Longrightarrow \beta = 1$.

6.3 The Characteristic Polynomial

The Inhomogeneous Case

Example:

$$T[n] = T[n-1] + 1$$
 $T[0] = 1$

Then,

T[n-1] = T[n-2] + 1 $(n \ge 2)$

Subtracting the first from the second equation gives,

$$T[n] - T[n-1] = T[n-1] - T[n-2] \qquad (n \ge 2)$$

or

19. Oct. 2021 74/106

19. Oct. 2021

76/106

$$T[n] = 2T[n-1] - T[n-2] \qquad (n \ge 2)$$

I get a completely determined recurrence if I add T[0] = 1 and T[1] = 2.

החוחר	6.3 The Characteristic Polynomial	19. Oct. 2021
Ernst Mayr, Harald Räcke		75/106

The Inhomogeneous Case

If f(n) is a polynomial of degree r this method can be applied r + 1 times to obtain a homogeneous equation:

$$T[n] = T[n-1] + n^2$$

Shift:

$$T[n-1] = T[n-2] + (n-1)^2 = T[n-2] + n^2 - 2n + 1$$

Difference:

$$T[n] - T[n-1] = T[n-1] - T[n-2] + 2n - 1$$

T[n] = 2T[n-1] - T[n-2] + 2n - 1

$$T[n] = 2T[n-1] - T[n-2] + 2n -$$

Shift:

$$T[n-1] = 2T[n-2] - T[n-3] + 2(n-1) - 1$$
$$= 2T[n-2] - T[n-3] + 2n - 3$$

Difference:

$$T[n] - T[n-1] = 2T[n-1] - T[n-2] + 2n - 1$$
$$- 2T[n-2] + T[n-3] - 2n + 3$$

$$T[n] = 3T[n-1] - 3T[n-2] + T[n-3] + 2$$

and so on...

6.4 Generating Functions

Example 9

1. The generating function of the sequence (1, 0, 0, ...) is

F(z)=1.

2. The generating function of the sequence $(1, 1, 1, \ldots)$ is

$$F(z) = \frac{1}{1-z}$$

6.4 Generating Functions

Definition 8 (Generating Function)

Let $(a_n)_{n\geq 0}$ be a sequence. The corresponding

generating function (Erzeugendenfunktion) is

$$F(z) := \sum_{n \ge 0} a_n z^n ;$$

 exponential generating function (exponentielle Erzeugendenfunktion) is

$$F(z) := \sum_{n \ge 0} \frac{a_n}{n!} z^n$$

6.4 Generating Functions

Ernst Mayr, Harald Räcke

19. Oct. 2021 **79/106**

6.4 Generating Functions

There are two different views:

A generating function is a formal power series (formale Potenzreihe).

Then the generating function is an algebraic object.

Let $f = \sum_{n\geq 0} a_n z^n$ and $g = \sum_{n\geq 0} b_n z^n$.

- **Equality:** f and g are equal if $a_n = b_n$ for all n.
- Addition: $f + g := \sum_{n \ge 0} (a_n + b_n) z^n$.
- Multiplication: $f \cdot g := \sum_{n \ge 0} c_n z^n$ with $c_n = \sum_{p=0}^n a_p b_{n-p}$.

There are no convergence issues here.

6.4 Generating Functions Ernst Mayr, Harald Räcke

unctions

19. Oct. 2021

80/106

6.4 Generating Functions

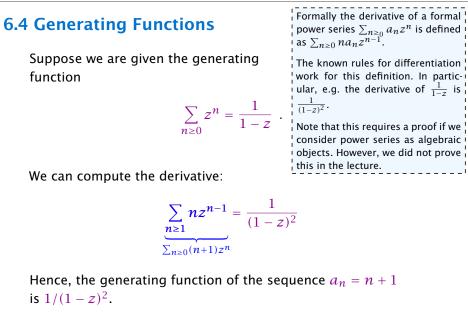

The arithmetic view:

We view a power series as a function $f : \mathbb{C} \to \mathbb{C}$.

Then, it is important to think about convergence/convergence radius etc.

Ernst Mayr, Harald Räcke

6.4 Generating Functions

19. Oct. 2021 84/106

19. Oct. 2021

82/106

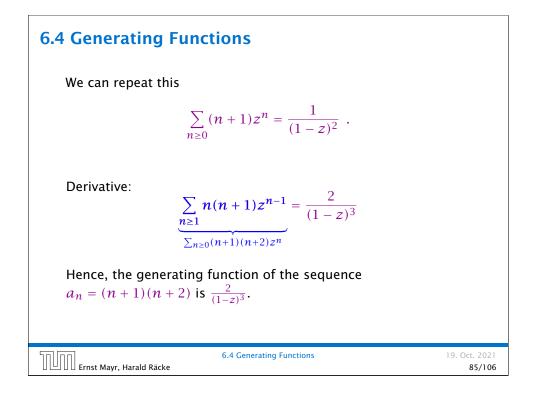

6.4 Generating Functions

What does $\sum_{n\geq 0} z^n = \frac{1}{1-z}$ mean in the algebraic view?

It means that the power series 1 - z and the power series $\sum_{n\geq 0} z^n$ are invers, i.e.,

$$(1-z)\cdot \left(\sum_{n\geq 0}^{\infty}z^n\right)=1$$
.

This is well-defined. Ernst Mayr, Harald Räcke 6.4 Generating Functions 19. Oct. 2021 83/106

6.4 Generating Functions

Computing the *k*-th derivative of $\sum z^n$.

$$\sum_{n \ge k} n(n-1) \cdot \ldots \cdot (n-k+1) z^{n-k} = \sum_{n \ge 0} (n+k) \cdot \ldots \cdot (n+1) z^n$$
$$= \frac{k!}{(1-z)^{k+1}} .$$

Hence:

$$\sum_{n\geq 0} \binom{n+k}{k} z^n = \frac{1}{(1-z)^{k+1}} \ .$$

The generating function of the sequence $a_n = \binom{n+k}{k}$ is $\frac{1}{(1-z)^{k+1}}$.

Solving Recursions with Generating Functions

- **1.** Set $A(z) = \sum_{n \ge 0} a_n z^n$.
- 2. Transform the right hand side so that boundary condition and recurrence relation can be plugged in.
- **3.** Do further transformations so that the infinite sums on the right hand side can be replaced by A(z).
- **4.** Solving for A(z) gives an equation of the form A(z) = f(z), where hopefully f(z) is a simple function.
- 5. Write f(z) as a formal power series. Techniques:
 - partial fraction decomposition (Partialbruchzerlegung)
 - lookup in tables
- **6.** The coefficients of the resulting power series are the a_n .

92/106

Example:
$$a_n = 2a_{n-1}, a_0 = 1$$

1. Set up generating function:

$$A(z) = \sum_{n \ge 0} a_n z^n$$

2. Transform right hand side so that recurrence can be plugged in:

$$A(z) = a_0 + \sum_{n \ge 1} a_n z^n$$

2. Plug in:

$$A(z) = 1 + \sum_{n \ge 1} (2a_{n-1})z^n$$

Ernst Mayr, Harald Räcke	6.4 Generating Functions	19. Oct. 2021 94/106

Example:
$$a_n = 2a_{n-1}$$
, $a_0 = 1$
5. Rewrite $f(z)$ as a power series:

$$\sum_{n \ge 0} a_n z^n = A(z) = \frac{1}{1 - 2z} = \sum_{n \ge 0} 2^n z^n$$

This leads to the following conditions:	
A + B + C = 1 $2A + 4B + 3C = 1$ $A + 3B = 1$	
which gives $A = \frac{7}{4} B = -\frac{1}{4} C = -\frac{1}{2}$	
6.4 Generating Functions	19. Oct. 2021 101/106

Example: $a_n = 3a_{n-1} + n$, $a_0 = 1$ 5. Write f(z) as a formal power series: $A(z) = \frac{7}{4} \cdot \frac{1}{1-3z} - \frac{1}{4} \cdot \frac{1}{1-z} - \frac{1}{2} \cdot \frac{1}{(1-z)^2}$ $= \frac{7}{4} \cdot \sum_{n \ge 0} 3^n z^n - \frac{1}{4} \cdot \sum_{n \ge 0} z^n - \frac{1}{2} \cdot \sum_{n \ge 0} (n+1)z^n$ $= \sum_{n \ge 0} \left(\frac{7}{4} \cdot 3^n - \frac{1}{4} - \frac{1}{2}(n+1)\right)z^n$ $= \sum_{n \ge 0} \left(\frac{7}{4} \cdot 3^n - \frac{1}{2}n - \frac{3}{4}\right)z^n$ 6. This means $a_n = \frac{7}{4}3^n - \frac{1}{2}n - \frac{3}{4}$.

6.5 Transformation of the Recurrence

Example 11

 $f_1 = 1$ $f_n = 3f_{\frac{n}{2}} + n$; for $n = 2^k$, $k \ge 1$;

Define

$$g_k := f_{2^k}$$

Then:

||||||||] Ernst Mayr, Harald Räcke

$$g_0 = 1$$

$$g_k = 3g_{k-1} + 2^k, \ k \ge 1$$

6.5 Transformation of the Recurrence

104/106

6.5 Transformation of the Recurrence

$$f_0 = 1$$

$$f_1 = 2$$

$$f_n = f_{n-1} \cdot f_{n-2} \text{ for } n \ge 2.$$

Define

 $g_n := \log f_n$.

Then

Example 10

```
g_n = g_{n-1} + g_{n-2} \text{ for } n \ge 2
g_1 = \log 2 = 1 (\text{for } \log = \log_2), \ g_0 = 0
g_n = F_n \text{ (n-th Fibonacci number)}
f_n = 2^{F_n}

103/106
```

6 Recurrences We get $g_{k} = 3 [g_{k-1}] + 2^{k}$ $= 3 [3g_{k-2} + 2^{k-1}] + 2^{k}$ $= 3^{2} [g_{k-2}] + 32^{k-1} + 2^{k}$ $= 3^{2} [3g_{k-3} + 2^{k-2}] + 32^{k-1} + 2^{k}$ $= 3^{3} g_{k-3} + 3^{2} 2^{k-2} + 32^{k-1} + 2^{k}$ $= 2^{k} \cdot \sum_{i=0}^{k} \left(\frac{3}{2}\right)^{i}$ $= 2^{k} \cdot \left(\frac{3}{2}\right)^{k+1} - \frac{1}{1/2} = 3^{k+1} - 2^{k+1}$

6 Recurrences

Let $n = 2^k$:

$$g_k = 3^{k+1} - 2^{k+1}, \text{ hence}$$

$$f_n = 3 \cdot 3^k - 2 \cdot 2^k$$

$$= 3(2^{\log 3})^k - 2 \cdot 2^k$$

$$= 3(2^k)^{\log 3} - 2 \cdot 2^k$$

$$= 3n^{\log 3} - 2n .$$
